Abstract

The prevalence of Type 2 Diabetes Mellitus (T2DM) is higher among Turkish immigrants than the general population in Norway. The aim of the study is to describe the challenges and experiences faced by Turkish immigrants in Norway in the self-management of T2DM. The study design is based on descriptive research using a qualitative approach. The sample group contained 13 persons participating in three focus group interviews: nine women and four men. A phenomenological-hermeneutical approach was employed to achieve a deeper understanding of the experience of self-management of T2DM among Turkish immigrants in Norway with regard to HL. The participants described experiences of the T2DM self-management with regard to HL and revealed three major themes: (1) understanding the role and responsibility of health care staff in T2DM treatment, (2) assessing T2DM education course and information and (3) applying knowledge and motivation to adapt to life with T2DM. Findings from this study revealed that self-management of patients with T2DM among Turkish immigrants is related to their cultural, religious and socio-economical background and experiences. By understanding the cultural features, a well-tailored intervention according to the needs of Turkish immigrants regarding self-management can be developed. Health care staff are recommended to consider patients' HL when interventions are developed.

Introduction

The prevalence of type 2 diabetes is high and rising across the world.¹ There are inequalities in the prevalence of T2DM in Europe; minorities develop T2DM at an earlier age than the host European population.^{2,3} T2DM in Norway is diagnosed up to 15 years earlier in first-generation immigrants from Asia.⁴ Research studies from Denmark, Austria, the Netherlands and Norway show that the preva-

self-perceived empowerment. No empirical evidence strengthening either the link between HL and glycaemic control or the link between HL behaviours was found.⁹ The Norwegian government defines HL as '*a person's ability to understand, assess and apply health information enabling them to make knowledge-based decisions related to their health. This applies to decisions related to lifestyle choices, disease prevention measures, self-management of health problems and health services*'¹⁰

Kurs, oppfølging av helsepersonell og informasjon

'At the general practitioner, the diagnosis was made, then he wrote (the prescription for) the injection (. . .) I bought it from the pharmacy, the girl there said a few words (about how to use the medicine). I came home and used it. I never got any other kind of help. I don't know any more, was it necessary to go to the hospital, to receive such a diabetes education course? They (the GP) never offered anything like that'. (P11)

'When it isn't explained properly, you just do what you think is best (. . .) people need to be given advice that is closer to their own culture and language'. (P10)

' . . . You feel more secure (in Turkey). You're saying, here's a Turkish doctor, let me pour it out, completely (. . .) My nephew is a dietitian in Istanbul (. . .) I ask him, and he sends me things monthly'. (P5)

Kurs, oppfølging av helsepersonell og informasjon

'I always go both here and in Turkey (. . .) There is no queue in Turkey, it's quick, the system is good, there's no problem if you have money'. (P8)

'My cousin's daughter is a doctor in Turkey. She told me to watch my sugar (T2DM)'. (P13)

'I don't trust Turkey as much as you do. More precisely, for some reason, as far as possible, I prefer the health sector in Norway rather than Turkey'. (P7)

Motivasjon og begrensninger

'So we all came from our country to another country. We experienced traumas, but we lived them without knowing it was trauma. And of course, eating habits. I also gained weight after that. I gained a lot of weight'. (P13)

'There is also the effect of our being in a foreign country (. . .) We cannot be involved in family matters when it is necessary to go to Turkey or when we need to go. We're obsessing over this'. (P7)

'It's good when I am alone in the house [and don't need to prepare more dishes]'. (P13)

'In fact, if people were left alone (. . .) then they would more pay attention (to themselves). For example, in my case'. (P10)

Diskusjon og oppsummering

- Kostholdsvaner en del av den kulturelle identiteten
- Støtte fra familie
- Mangel på startkurs
- Second opinion og sterke bånd til Tyrkia
- Tyrkisk som foretrukket språk
